# Ease-Flex for Cats

## *Soft Chews*

### JOINT SUPPLEMENTS

The use of joint nutrient supplements, glucosamine, chondroitin sulphate and MSM to soothe stiff joints and help maintain mobility in aging cats is well established. These are normally used as part of a management program that includes nutrition, exercise and drug therapies.

### PATIENT COMPLIANCE

Patient compliance is an essential consideration for products that are chronically administered. To maximize compliance it is vital that such products are presented in a tasty base; one that will not eventually bore the cat and lead to resistance.

### Ease-Flex SOFT CHEWS

Ease-Flex for Cats Soft Chews are composed of a highly tasty flavouring cats enjoy. The soft triangular shape is eagerly accepted over a prolonged period of time. Ease-Flex for Cats Soft Chews are readily digested and can be fed as a treat prior to or during a meal, even to ageing cats with dental problems.

Ease-Flex for Cats Soft Chews contains high levels of glucosamine, chondroitin sulphate and MSM, a source of bio-available sulphur. In addition Manganese Ascorbate is added to act as an antioxidant to help neutralise free radicals. Each chew contains the normally recommended amount of these ingredients for cats.

A high degree of individual response has been noted with pets given joint nutrient supplements. It is normal to give a double amount of joint nutrients for the first six weeks of the program, reducing the amount thereafter. Normal caution should be observed in cats with a history of diabetes, metabolic disorders causing hyperglycaemia, urinary tract stones or allergies to shellfish.
